KEYMACRO is a Win32 utility to perform keypresses of any character on-screen keyboard. As a shortcut, it's just like any text editor, but can be used on any active window. KEYMACRO works with all mouse or keyboard shortcuts (eg. CTRL-C, CTRL-X, CTRL-V, ALT-TAB, CTRL-ALT-TAB). It can also be used to emulate normal keyboard shortcuts (e.g. CTRL-A works like CTRL-ALT-A). This allows you to turn on/off the Win key, menu key, and task bar keys. It can also emulate physical keyboard or remote control presses (e.g. CTRL-S, CTRL-Q, CTRL-Z, CTRL-F2). It can work in both a windowed and a multi-monitor setup. KEYMACRO Features:

- Displays the on-screen keyboard.
- Displays only the keyboard characters you choose to show.
- Mouse clicks are activated when you press CTRL and the arrow keys.
- Supports the following keyboard shortcuts (all programs that take shortcuts must be allowed):

- CTRL-C - CTRL-X - CTRL-V - CTRL-TAB - CTRL-ALT-TAB - CTRL-F2 - CTRL-F3 - CTRL-F4 - CTRL-F5 - CTRL-F6 - CTRL-F7 - CTRL-F8 - CTRL-F9 - CTRL-F10 - CTRL-F11 - CTRL-F12 - CTRL-H - CTRL-J - CTRL-K - CTRL-L - CTRL-M - CTRL-N - CTRL-O - CTRL-P - CTRL-Q - CTRL-R - CTRL-S - CTRL-T - CTRL-U - CTRL-V - CTRL-Z - CTRL-F11 (shows the current command) - CTRL-F12 (shows the previous command) - CTRL-H (the terminal) - CTRL-J (pivot point) - CTRL-K (the terminal) - CTRL-L (the terminal) - CTRL-M (the terminal) - CTRL-N (the terminal) - CTRL-O (the terminal) - CTRL-P (the terminal) - CTRL-Q (the terminal) 77a5ca646e

I mistakenly ran the following command on my machine: git config --global user.name "tommy" I want to change it back to "myname". But when I ran: git config --global user.name "myname" it doesn't do anything. What's the command I need to run to change my username back to "myname"? A: You can use git config --global user.email, for example: git config --global user.email'mymail@example.com' I'm not familiar with this (I use GitHub) but a little googling suggests you can also reset the username to your email by doing: git config --global user.email "tommy@example.com" This is documented here (amongst other places). A: As a workaround, you can reset the

config file back to its original: `git config --global --unset user.name` And then change it back: `git config --global --set user.name "myname"` A: To help you understand the config file, try: `git config --help` For details, see "What exactly is stored in .git/config and how can I edit it?" Q: Static field initialization: default constructor or class initializer list I'm trying to figure out if it is appropriate to initialize a static field in the default constructor (in this case, the class constructor with the implicit this, i.e. no parameters), or if it should be placed in the class initializer list: `// private static field (not final) private static List types; public SomeClass() { // or this: types = new List(); // is this ok: // types.Add(typeof(SomeEnum)); }` Is it better to do it in a class initializer list, or just in the constructor? I know it can be done in both ways, but
